Task:

Make a React createPortal example page

Using the existing page navigation structure, add a new page that contains a small example of using **createPortal.**

The goal is that other engineers can look at the page + source code to quickly see an example of how to use **createPortal** and what the working code might look like.

Solution suggestion:
- Have a button that when clicked, shows a modal component rendered on the document.body instead of in the component tree.

Application

Home

Example: React Query

Example: React Query

This page shows an example of using React Query.

Show modal on the body using createPortal
